-----

The temperature of a planet can tell us a lot about its composition, atmosphere, and potential to support life. From the scorching heat of Venus to the icy chill of Pluto, each planet offers ...

Learn more about the theoretical versus actual temperature of the solar system, as well as thermal equilibrium, the solar constant, and albedo.

The solar system is a diverse and dynamic place with a wide range of temperatures, from the scorching heat of Venus to the cold of Neptune and Pluto. Understanding these temperature ...

Space is very, very cold. The baseline temperature of outer space is 2.7 kelvins -- minus 454.81 degrees Fahrenheit, or minus 270.45 degrees Celsius -- meaning it is barely above absolute ...

o Venus" thick atmosphere traps and stores the solar heat, giving it the highest surface temperature of the planets. This is above the melting points of lead and some metallic compounds. o Earth lies near ...

This graphic shows the mean temperatures of various destinations in our solar system.

We mean waaaay out there in our solar system - where the forecast might not be quite what you think. Let's look at the mean temperature of the Sun, and the planets in our solar system.

The table below explains the effects of different variables on both the surface temperature ( $T_s$ ) and the atmospheric temperature ( $T_a$ ) from the above equations. The fluxes from which the values are ...

Space is very, very cold. The baseline temperature of outer ...

Explore temperature extremes across the solar system, from Mercury to Neptune, and their impact on planetary climates and habitability.
