What are energy storage systems?

Energy storage systems are not primary electricity sources, meaning the technology does not create electricity from a fuel or natural resource. Instead, they store electricity that has already been created from an electricity generator or the electric power grid, which makes energy storage systems secondary sources of electricity.

How do energy storage systems work?

Instead, they store electricity that has already been created from an electricity generator or the electric power grid, which makes energy storage systems secondary sources of electricity. Energy storage systems use more electricity for charging than they provide when supplying electricity to the electricity grid.

What are battery storage power stations?

Battery storage power stations are usually composed of batteries, power conversion systems (inverters), control systems and monitoring equipment. There are a variety of battery types used, including lithium-ion, lead-acid, flow cell batteries, and others, depending on factors such as energy density, cycle life, and cost.

Why are secondary sources of electricity included in our annual electric generator report?

Secondary sources of electricity such as batteries are included in our Annual Electric Generator Report and in our preliminary monthly electric generator inventory data because they provide the capacity to meet load even though energy storage systems do not generate electricity directly.
